

Function as a part of parameter in PHP

PHP provides super easy feature can put a function as a part of function parameter. You can just put it like function exampleMethod(\$customFunc).

In order to do it, the function must be coded like a variable as below:

```
$myFunc = function( $param1, $param2)
{
    your logic...
};
```

Note that the function variable must be declared like a normal variable, and its functional code must be ended by semicolon.

Below is an example

```
<?

function test( $customFunc, $a, $b)
{
    return $customFunc( $a, $b);
}

$custMul = function($a, $b)
{
    return ($a*$b);
};

$custDiv = function($a, $b)
{
    return ($a/$b);
};

echo test( $custMul, 4, 2) . "\n";
echo test( $custDiv, 4, 2) . "\n";

?>
```
