Delete one element in PHP array

The **unset**() function in **PHP** resets any variable. If **unset**() is called inside a user-defined function, it unsets the local variables. If a user wants to **unset** the global variable inside the function, then he/she has to use $GLOBALS array to do so. The **unset**() function has no return value.

```php
<?php

    $array = [0 => "a", 1 => "b", 2 => "c"];
    unset($array[1]);
               // Key which you want to delete

?>
```
