

Install mod_url to support multi byte characters on CentOS 7

mod_url enables httpd to support multibyte characters like Korean file, so you can download Korean file () from your apache server without any error message. httpd basically does not support it, so you should install mod_url.

STEP 1. Download mod_url from KLDP and deploy it

```
wget http://jini.kldp.net/modurl/release/2186-mod_url-apache2-1.6.2.6.tar.bz2
tar xvfj 2186-mod_url-apache2-1.6.2.6.tar.bz2
cd mod_url-apache2
/usr/bin/apxs -iac mod_url.c
```

STEP 2. Modify /etc/httpd/conf/httpd.conf

Below code needs to be added

```
### mod_url
<IfModule mod_url.c>
CheckURL On
ServerEncoding EUC-KR
ClientEncoding UTF-8
</IfModule>
```
