

How to avoid CORS errors on CentOS 7

To avoid CORS errors, following configs needs to be added to fully CORS-enable an Apache web server in <Directory>, <Location>, <Files>, <VirtualHost> of **/etc/httpd/conf/httpd.conf** or **.htaccess**

```
Header set Access-Control-Allow-Origin "*"
Header set Access-Control-Allow-Headers "*"
Header set Access-Control-Allow-Methods "*"
```

To ensure that your changes are correct, strongly recommended that you use

```
apachectl -t
```

to check your configuration changes for errors. After this passes, you may need to reload Apache to make sure your changes are applied by running the command

```
sudo service httpd restart
```

To test if your server has no issue associated with CORS, please visit <http://www.test-cors.org>
