

Creating multiple GitLab merge requests in CLI.

Whenever I need to create multiple merge requests for Git, I use shell scripts in CLI.

```
#!/bin/bash
merge_request() {
    cd $1

    git fetch "git@gitlab.its-newid.net:$1/$2.git" master
    git checkout -b "$1/$2-master" FETCH_HEAD
    git fetch origin
    git checkout "master"
    git merge --no-ff "$1/$2-master"
    git push origin "master"

    cd ..
}

merge_request dev _env
merge_request dev _lib
merge_request dev _bot
merge_request dev api.its-newid.net
merge_request dev ads.its-newid.net
merge_request dev partner.its-newid.net
merge_request dev live.its-newid.net
```

In above case, you will need to register SSH certificate at GitLab server.
