

Check if user is root or sudo in php

`posix_getuid()` returns non-zero if user is root or sudo, so you can warn user to use an appropriate permission if required.

```
<?php

// check if the user is root or executed in sudo mode
if (posix_getuid() != 0)
{
    echo "Error: please run \"php {$argv[0]}\" in root or sudo\n\n";
    exit;
}

?>
```
