

The page visibility API to check if the browser's tab is active or not in JavaScript

You can use the page visibility API to check whether the current tab is active, closed, or minimized. Whenever the user changes the tab, minimizes it, or opens it again, the `visibilitychange` event gets triggered in the document.

```
document.addEventListener("visibilitychange", () => {  
  if (document.hidden) {  
  
    // tab is changed  
  } else {  
  
    // tab is active  
  }  
});
```
