

Checking XML element by preg_match

Below code shows how to check XML element by preg_match

```
function crcExists($crc32) {
    $fp = @fopen( "./crc32.xml" , "r" );
    if ($fp) {
        while( !feof($fp)) {
            $buff = fgets($fp, 10240);
            $buff = trim($buff);
            echo $buff . "\n";
            $buff=str_replace("\n", "", $buff);
            if (preg_match("/<crc32>" . $crc32 . "</crc32>/" , $buff)) {
                echo "url found<br>";
                return true;
            }
        }
        fclose($fp);
    }
    return false;
}
```
